In the Claims

This listing of claims will replace all prior versions and listings of claims in the application:

- (Previously Presented) A method of generating energy
- 2 profiles for a specific task in a processing device executing
- 3 multiple tasks, comprising the steps of:
- 4 receiving a first task identifier indicative of an active task
- 5 in a processing component;
- 6 receiving hardware activity signals each indicative of a
- 7 hardware event in the processing device;
- 8 storing a second task identifier indicating a task to be
- 9 monitored;
- 10 comparing the first and second task identifiers and generating
- 11 a predetermined signal if the first and second task identifiers
- 12 match;
- measuring activity corresponding to the task to be monitored
- 14 by counting hardware activity signals received during generation of
- 15 said predetermined signal.

2 and 3. (Canceled)

- 1 4. (Previously Presented) The method of claim 1 further 2 comprising:
- 3 periodically updating with a period T an energy profile
- 4 responsive to said measuring step during operation of said
- 5 processing device.
- 1 5. (Original) The method of claim 4 and further comprising
- 2 the step of executing a plurality of tasks in accordance with a
- 3 scenario defining scheduling of said plurality of tasks and

- 4 modifying said scenario responsive to said step of updating an
- 5 energy profile.
- 1 6. (Original) The method of claim 1 and further comprising
- 2 the step of performing a debugging operation responsive to said
- 3 measuring step.
- 7. (Previously Presented) A processing device for
- 2 multitasking multiple tasks comprising:
- 3 circuitry for receiving a first task identifier selected from
- 4 among a plurality of possible task identifiers indicative of an
- 5 active task in a processing component;
- 6 circuitry for receiving hardware activity signals each
- 7 indicative of a hardware event in the processing device;
- 8 a memory for storing a plurality of second task identifier,
- 9 each second task identifier corresponding to a task to be
- 10 monitored;
- 11 a comparator for comparing the first and second task
- 12 identifiers and generating a predetermined second task identifier
- 13 match signal if the first task identifier matches a corresponding
- 14 one of said second task identifiers;
- a plurality of counters, each counter corresponding to one of
- 16 said stored plurality of second task identifiers, each counter
- 17 enabled to count said hardware activity signals when said
- 18 comparator generates a corresponding predetermined second task
- 19 identifier match signal.

8 and 9. (Canceled)

- 1 10. (Previously Presented) The processing device of claim 7
- 2 wherein:

- said processing device is operable to periodically update with a period T an energy profile from counts of said plurality of counters during operation of said processing device.
- 1 11. (Original) The processing device of claim 10 wherein said 2 plurality of tasks are executed in accordance with a scenario 3 defining scheduling of said plurality of tasks and said scenario is 4 updated responsive to said step of updating an energy profile.
- 1 12. (Previously Presented) The processing device of claim 7 2 and further comprising circuitry for implementing a debugging 3 operation responsive to values in said plurality of counters.

13. (Canceled)

- 1 14. (Previously Presented) The method of claim 1 wherein:
- said hardware event in the processing device includes a cache
- 3 miss.
- 1 15. (Previously Presented) The method of claim 1 wherein:
- 2 said hardware event in the processing device includes a
- 3 translation lookaside buffer miss.
- 1 16. (Previously Presented) The method of claim 1 wherein:
- said hardware event in the processing device includes a non-
- 3 cacheable memory access.
- 1 17. (Previously Presented) The method of claim 1 wherein:
- said hardware event in the processing device includes a wait
- 3 time.

- 1 18. (Previously Presented) The method of claim 1 wherein:
- 2 said hardware event in the processing device includes a
- 3 read/write requests for a predetermined resource.
- 1 19. (Previously Presented) The method of claim 4 wherein:
- 2 said period T corresponds to a thermal time constant of the
- 3 processing device.
- 1 20. (Previously Presented) The processing device of claim 7
- 2 wherein:
- 3 said hardware event in the processing device includes a cache
- 4 miss.
- 1 21. (Previously Presented) The processing device of claim 7
- 2 wherein:
- 3 said hardware event in the processing device includes a
- 4 translation lookaside buffer miss.
- 1 22. (Previously Presented) The processing device of claim 7
- 2 wherein:
- 3 said hardware event in the processing device includes a non-
- 4 cacheable memory access.
- 1 23. (Previously Presented) The processing device of claim 7
- 2 wherein:
- 3 said hardware event in the processing device includes a wait
- 4 time.
- 1 24. (Previously Presented) The processing device of claim 7
- 2 wherein:
- 3 said hardware event in the processing device includes a
- 4 read/write requests for a predetermined resource.

- 1 25. (Previously Presented) The processing device of claim 10
- 2 wherein:
- 3 said period T corresponds to a thermal time constant of the
- 4 processing device.
